Digital Displacement Decoder

D-DD-5N-30

Ultrafast FPGA-based Digital Signal Processing

Optomet Vibrometers feature an end-to-end FPGA-based digital signal processing allowing a fully digital read-out of the measurement data. Digital signal processing avoids any drawbacks of analog demodulation which may result from component aging, temperature dependencies, noise and non-linearities. Significantly higher sensitivity, better resolution, and stability are the benefits of Optomet's end-to-end digital signal processing. Extremely low noise levels produce precise results even from poorly reflecting measurement objects.

HIGHLIGHTS:

- Digital decoder

- 19 displacement measuring ranges

- Frequency range: DC bis 25 MHz

- Max. velocity up to 30 m/s

- Resolution down to 50 femtometers

High-End Master Displacement Decoder 30 m/s

All vibrometers series feature by default a velocity decoder and can be supplemented with a suitable displacement and/or acceleration decoder.

The D-DD-5N-30 expands the frequency bandwidth up to 25 MHz, is especially used for ultrasonic applications.
Required velocity decoder: D-VD-5N-30
