LASER VIBROMETRY

# Digital Displacement Decoder D-DD-0N 

## Ultrafast FPGA-based Digital Signal Processing

Optomet Vibrometers feature an end-to-end FPGA-based digital signal processing allowing a fully digital read-out of the measurement data. Digital signal processing avoids any drawbacks of analog demodulation which may result from component aging, temperature dependencies, noise and non-linearities. Significantly higher sensitivity, better resolution, and stability are the benefits of OptoMET's end-to-end digital signal processing. Extremely low noise levels produce precise results even from poorly reflecting measurement objects.

| HIGHLIGHTS: | Start Displacement Decoder |
| :---: | :---: |
| - Digital decoder | All vibrometers series feature by default a velocity decoder and can be supplemented with a suitable displacement and/or acceleration decoder. |
| - 19 displacemert measuring ranges | The D-DD-ON displacement decoder is a versatile solution for various applications in noncontact vibration measurement. It features 19 displacement measuring ranges and can measure up to 100 kHz with a maximum velocity of the measured object of $2.5 \mathrm{~m} / \mathrm{s}$. Digital signal processing provides excellent linearity and measuring accuracy. Required velocity decoder: D-VD-ON |
| - Frequency range: DC bis 100 kHz |  |
| - Max. velocity up to $2.5 \mathrm{~m} / \mathrm{s}$ |  |
| - Resolution* down to 50 femtometers |  |
|  | * The resolution is defined as the signal amplitude (rms) that produces 0 dB signal/noise ratio with 1 Hz spectral resolution at $50 \%$ fmax. |

Technical data

| Pos. | Full Scale Output peak to peak $\mu \mathrm{m}$ | Signal Frequency Range kHz | Max. Velocity $\mathrm{m} / \mathrm{s}$ |
| :---: | :---: | :---: | :---: |
| 1 | 0.245 | $0 . . .100$ | 2.5 |
| 2 | 0.49 | $0 . . .100$ | 2.5 |
