## Digital Velocity Decoder

## D-VD-2N

## Ultrafast FPGA-based Digital Signal Processing

Optomet Vibrometers feature an end-to-end FPGA-based digital signal processing allowing a fully digital read-out of the measurement data. Digital signal processing avoids any drawbacks of analog demodulation which may result from component aging, temperature dependencies, noise and non-linearities. Significantly higher sensitivity, better resolution, and stability are the benefits of OptoMET's end-to-end digital signal processing. Extremely low noise levels produce precise results even from poorly reflecting measurement objects.

## High-Precision Sense Velocity Decoder

All vibrometers series feature by default a velocity decoder and can be supplemented with a suitable displacement and/or acceleration decoder.

The D-VD-2N velocity decoder has been specially developed to register even the smallest mechanical vibrations and motions. It has 11 velocity measuring ranges from $2.45 \mathrm{~mm} / \mathrm{s}$ to $5 \mathrm{~m} / \mathrm{s}$ and is not only ultrasensitive in detecting tiny vibrations up to $1.7 \mathrm{~nm} / \mathrm{s}$, but is also ideal for standard vibration measurements in the acoustic and ultrasonic ranges (up to 1 MHz ).
